ABOUT THE SURGEON

About Dr. Pramod V. Lokhande

Dr. Pramod Lokhande is a leading spine surgeon in India with over **24 years of exclusive experience in spine surgery**, specializing in full endoscopic spine surgery and minimally invasive spine surgery.

A **pioneer of full endoscopic interlaminar spine surgery in India**, he is internationally recognized as an expert in treating complex spinal conditions such as slip disc (lumbar disc herniation), sciatica, spinal canal stenosis, spondylolisthesis, spinal

infections, tumors, and spinal deformities involving the cervical, thoracic, and lumbar spine.

Widely regarded among the best endoscopic spine surgeons in India, having performed **5000+ surgeries** to date. Dr. Lokhande is a sought-after faculty at major national and international conferences, where he performs live endoscopic spine surgeries, delivers expert lectures, and conducts cadaver training workshops for orthopedic surgeons and neurosurgeons.

His practice focuses on minimally invasive spine treatment, faster recovery, reduced pain, and precision-driven outcomes.

ADVANCED FELLOWSHIP TRAINING

KR South Korea | DE Germany | FR France | CH Switzerland | JP Japan

WHY CHOOSE ENDOSCOPIC SURGERY

Minimally invasive spine surgery, maximum precision.

Through an incision smaller than a fingertip, a high-definition endoscope gives a magnified, crystal-clear view of the nerve — so the problem is treated, and the healthy muscle is left alone.

Tiny incision

A single small keyhole incision instead of a long open cut — minimal scarring.

Minimal muscle damage

Muscles are gently dilated, not cut or stripped from the spine.

Less pain, less blood loss

Significantly less post-operative pain and negligible blood loss.

Walk the same day

A day-care procedure — most patients walk the same day and go home within 24 hours.

Lower complication rate

A magnified, clear field of vision through continuous saline irrigation means greater safety.

Faster return to life

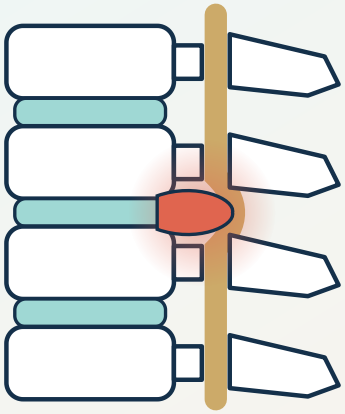

Back to work and daily activities much earlier than after open spine surgery.

	Full Endoscopic Surgery	Open Spine Surgery
Incision	**Small keyhole**	Long open incision
Muscle damage	**Minimal**	Significant
Post-op pain	**Low**	Moderate to high
Hospital stay	**Day care · within 24 hours**	Several days
Walking	**Same day**	Delayed
Complication rate	**Significantly lower**	Higher

CONDITIONS TREATED

Slip disc treatment without open surgery — and much more.

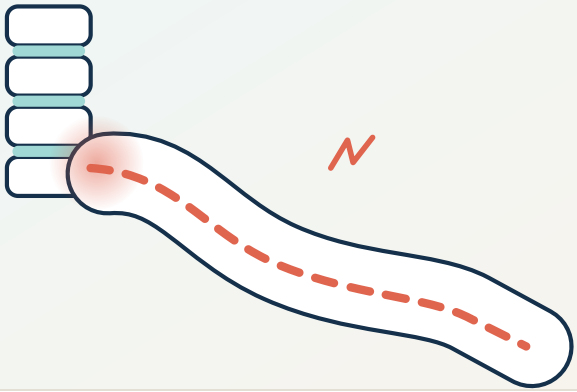

From a sciatica treatment specialist's everyday cases to complex spinal pathology across the entire spine.

MOST COMMON

Slip Disc

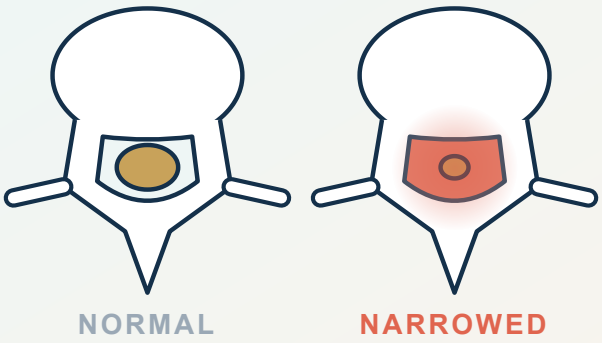

Lumbar disc herniation treated by endoscopic discectomy — the disc fragment removed through a keyhole.

LEG PAIN

Sciatica

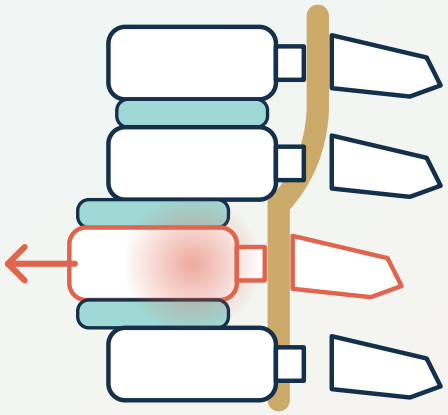

Radiating leg pain and numbness from a compressed nerve root, relieved with precision decompression.

NARROWING

Spinal Canal Stenosis

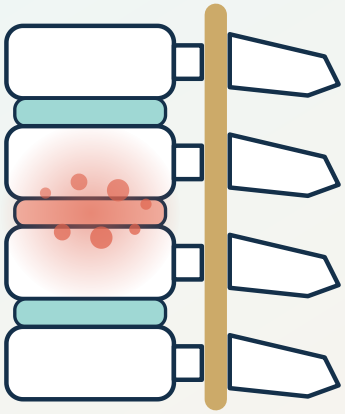

Endoscopic decompression to free compressed nerves and restore walking distance.

INSTABILITY

Spondylolisthesis

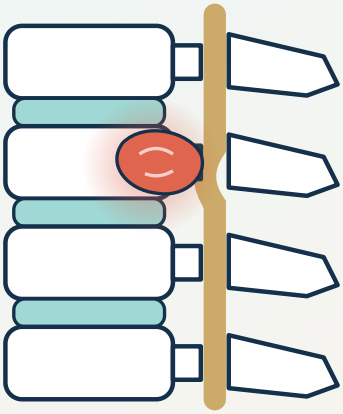

Slippage of one vertebra over another, managed with minimally invasive techniques.

INFECTION

Spinal Infections

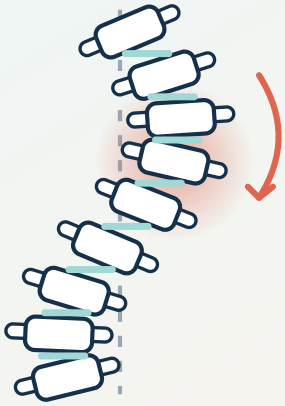

Endoscopic debridement and drainage with minimal disruption to surrounding tissue.

GROWTHS

Spinal Tumors

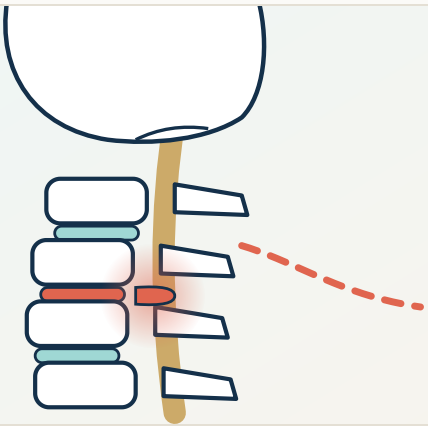

Selected spinal tumors addressed with precision minimally invasive approaches.

ALIGNMENT

Spinal Deformities

Expert evaluation and treatment of deformities of the cervical, thoracic and lumbar spine.

NECK

Cervical Disc Problems

Neck and arm pain from cervical disc disease, treated with endoscopic techniques.

Cervical spine

Thoracic spine

Lumbar spine

INSIDE THE OPERATING ROOM

Watch a full endoscopic spine surgery.

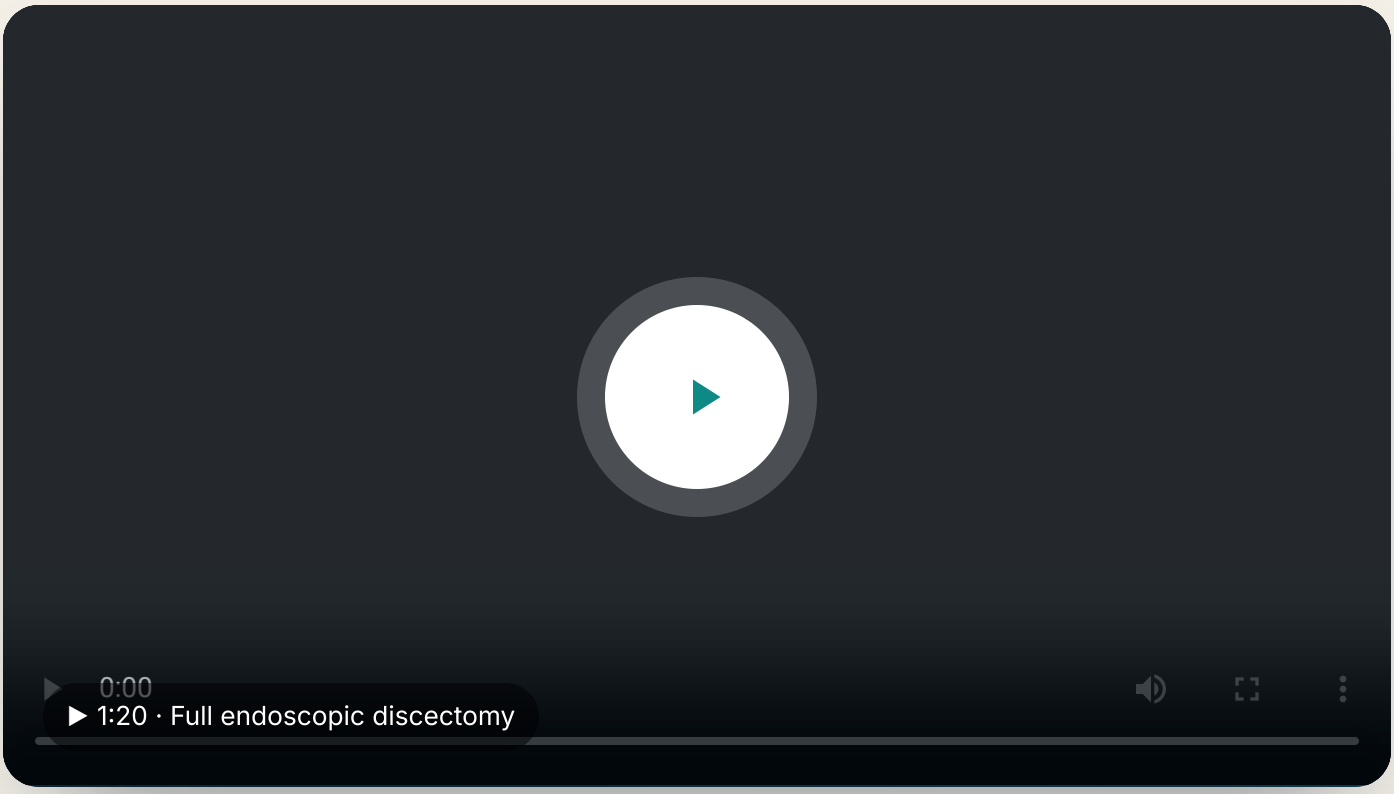

See how a herniated disc is removed through a keyhole incision under high-definition endoscopic vision.

01 Keyhole access through a small incision

02 HD camera view under saline irrigation

03 Precise removal of the disc fragment

04 Nerve freed — patient walks the same day

RECOGNITION & TEACHING

A surgeon other surgeons learn from.

Dr. Lokhande trains orthopedic surgeons and neurosurgeons in full endoscopic spine surgery across India and abroad.

Awards & Recognitions

Recognised nationally and internationally for pioneering full endoscopic interlaminar spine surgery in India.

Faculty at Conferences

Sought-after faculty and invited speaker at major national and international spine conferences.

Live Surgical Demonstrations

Performs live endoscopic spine surgeries broadcast to surgeons at conferences and workshops.

International Collaborations

Fellowship-trained in South Korea, Germany, France, Switzerland and Japan, with ongoing global ties.

FOR SURGEONS

Training & Workshops in Endoscopic Spine Surgery

Hands-on cadaver training workshops for orthopedic surgeons and neurosurgeons, covering interlaminar and transforaminal endoscopic techniques.

ON STAGE

Live Surgical Demonstrations

Real-time endoscopic spine surgeries performed for audiences at national and international conferences, with step-by-step expert commentary.

YOUR JOURNEY

Spine surgery with faster recovery.

01

Consultation

Detailed history, examination and review of your MRI.

02

Evaluation

Conservative care first; surgery only if truly indicated.

03

Day-care surgery

Full endoscopic procedure through a keyhole incision.

04

Walk same day

Most patients walk within hours and go home within 24h.

05

Back to life

Early return to work and normal daily activities.

FAQ

Questions patients ask.

Still unsure whether endoscopic spine surgery is right for you? Ask Dr. Lokhande directly.

Ask a Question

What is endoscopic spine surgery?

Endoscopic spine surgery is a minimally invasive technique performed through a small incision using a high-definition camera and specialized instruments. It allows precise treatment of spinal conditions with minimal damage to muscles and faster recovery.

Is endoscopic surgery safe?

Yes, endoscopic spine surgery is considered safer than open or microscope-assisted surgeries when performed by an experienced spine surgeon. Because of the magnified and clear field of vision, the complication rates are negligible compared to traditional spine surgery. It also offers advantages such as less pain, reduced blood loss, and quicker recovery.

What conditions can be treated with endoscopic spine surgery?

Endoscopic spine surgery can treat conditions such as slip disc (disc herniation), sciatica, spinal canal stenosis, spondylolisthesis, spinal infections and tumors affecting the cervical, thoracic, and lumbar spine.

What is the recovery time after endoscopic spine surgery?

Recovery after endoscopic spine surgery is much faster than traditional surgery. Many patients can walk the same day and are discharged within 24 hours, so it is a day-care procedure. Return to normal activities is much earlier with full endoscopic spine surgery.

Endoscopic vs open spine surgery – which is better?

Endoscopic spine surgery offers several advantages over open surgery: smaller incisions, minimal muscle damage, less pain, shorter hospital stay, and faster recovery. The complication rate is also significantly lower because of the magnified and clear field of vision provided by saline irrigation.

Who is the best candidate for endoscopic spine surgery?

Patients with disc herniation, sciatica, or spinal stenosis who have not improved with conservative treatment are often good candidates. A detailed evaluation by a spine specialist is necessary to determine suitability.

What is the cost of endoscopic spine surgery in India?

The cost of endoscopic spine surgery in India varies depending on the condition, hospital, and complexity of the procedure. It is not very high compared to open surgery, and it is generally more cost-effective than many international centers while maintaining high-quality care.
